Department of Computer Science and Engineering (Data Science)

Aim: Implement Bi-Gram model for the given Text input

Objective: To study and implement N-gram Language Model.

Theory:

A language model supports predicting the completion of a sentence.

Eg:

- Please turn off your cell _____
- Your program does not _____

Predictive text input systems can guess what you are typing and give choices on how to complete it.

N-gram Models:

Estimate probability of each word given prior context.

$P(\text{phone} \mid \text{Please turn off your cell})$

- Number of parameters required grows exponentially with the number of words of prior context.
- An N-gram model uses only $N-1$ words of prior context.
 - Unigram: $P(\text{phone})$
 - Bigram: $P(\text{phone} \mid \text{cell})$
 - Trigram: $P(\text{phone} \mid \text{your cell})$
- The Markov assumption is the presumption that the future behavior of a dynamical system only depends on its recent history. In particular, in a k th-order Markov model, the next state only depends on the k most recent states, therefore an N-gram model is a $(N-1)$ -order Markov model.

N-grams: a contiguous sequence of n tokens from a given piece of text

Mary was scared because of the terrifying noise. ...

Fig. Example of Trigrams in a sentence

```
#removes ngrams containing only stopwords
def removal(x):
    y = []
    for pair in x:
        count = 0
        for word in pair:
            if word in stop_words:
                count = count or 0
            else:
                count = count or 1
        if (count==1):
            y.append(pair)
    return(y)
```

Next word predictions for the strings using the probability models of bigrams, trigrams, and fourgrams

String 1 - after that alice said the-

Bigram model predictions: ['queen', 'king', 'gryphon', 'mock', 'hatter']
Trigram model predictions: ['king', 'hatter', 'mock', 'caterpillar', 'gryphon']
Fourgram model predictions: ['NOT FOUND', 'NOT FOUND', 'NOT FOUND', 'NOT FOUND', 'NOT FOUND']

String 2 - alice felt so desperate that she was-

Bigram model predictions: ['e', 'the', 'not', 'that', 'going']
Trigram model predictions: ['now', 'quite', 'e', 'walking', 'beginning']
Fourgram model predictions: ['now', 'ready', 'walking', 'losing', 'in']
```

Conclusion:

The N-gram language model is a simple and widely used approach for natural language processing tasks, such as text generation and speech recognition. It operates by analyzing the statistical relationships between words in a given text, with "N" representing the number of preceding words considered for prediction. While N-gram models are easy to implement and computationally efficient, they have limitations in capturing long-range dependencies and understanding context. As a result, they may struggle with handling more complex language tasks compared to more advanced models like recurrent neural networks or transformer-based models. In conclusion, N-gram language models are a valuable tool for certain applications but may fall short in tasks that require a deeper understanding of language and context.
